Lubricating the Platestream Punch Compressor

Applicable Products:

PlateStreams and PlateStream46s with integrated punch options

Weekly lubrication of the punch compressor ensures long life and reliable operation.

Several customers have expressed confusion over the type of lubricant to use, however. The compressor requires a special lubricant (Printware part number 901176-002).

DO NOT USE ORDINARY LUBRICANTS; they can cause the compressor to seize.

The lubrication procedure is as follows:

- Check the lubricant level in the sight glass weekly with the compressor running.
- The level should be at least half full.
- Add lubricant until the sight glass is half full.
- Clean the filter in the filler cap with isopropyl alcohol, allow to dry thoroughly, then replace.
